Mobile: +82-(0)10-3332-5603
Email: hello@hyunsangcho.com
Homepage: <https://hyunsangcho.com>

! All work images and documents used in this portfolio are **my own process and results**.
! The portfolio should **only be used for job application purposes**.

This portfolio consists of five main chapters. First, I will briefly introduce my career and then share several past projects that demonstrate what I consider important in UX design based on my experiences.

- 1. Extensive Experience**
- 2. Defining Problems**
- 3. Agile Delivery**
- 4. Value Validation**
- 5. Human-Centric**

1. Extensive Experience

Various positions, diverse work environments, and many problem-solving in various projects

The insights and expertise gained from various projects have proven invaluable for improving outcomes in subsequent work. Through these experiences, I've developed strong capabilities in UX design, systematic problem-solving, and team leadership. Moreover, collaborating with talented colleagues from diverse cultural backgrounds and industries has significantly enhanced my flexibility of thinking and creativity. These experiences have broadened my expertise across multiple areas and built a solid foundation for delivering innovative solutions.

Agencies and in-house design groups, from junior designer to director

2. Defining Problems

Various positions, diverse work environments,
and many problem-solving in various projects

Based on my experience, projects without clear problem definitions have always encountered issues during their execution. This is because a well-defined problem allows the team to share a common goal, serving as a North Star that consistently guides them in the right direction. Some might question how to approach unprecedented projects, but design projects always revolve around users or target audiences, enabling us to define problems through hypothesis-based approaches. I've participated in research phases across numerous projects.

par BNP PARIBAS

Hello Bank! UX Review

Client: BNP Paribas

Role: Senior UX Architect

Outcome: 200-page review report including improvement recommendations

Link: <https://hyunsangcho.com/portfolio/hello-bank-expert-review/>

This was a UX review project for Hello Bank!, the digital bank of BNP Paribas. Since all their services were developed by their in-house team, an objective analysis was needed. To achieve this, I visited Hello Bank! local branches across four European countries to conduct interviews and developed a scoring system based on their initial brand philosophy to review usability and objectively identify issues. As a result, we were able to identify country-specific service issues and contribute to their next release.

Scoring System

How we use it

For each specified user scenario (broken down by task), the apps and web service will be evaluated against the 10 experience principles. Each task in the process will be given a score ranging from 0-2 (as defined below). Within the total score, the number of identified issues will be shown. For example, Navigation scores 0 (likely negative experience) and has a sum of 5 issues identified.

In the summary and analysis, the complete score summary will be shown, and the Achievement percentage and Issue Severity will be calculated and plotted on radar graphs for a visual representation of the multiple data points.

Achievement % Score:

[Actual Score / Potential Score]
A task can score maximum of 2 across all specified tasks. The Potential 'highest' Score is the total number of tasks. For example, multiply them, 4x2, then the p

Issue Severity Score:

[Total sum of identified issues / Total number of issues]
The Severity Issue section is a percentage figure and plotted

0

Likely negative experience

HELLO BANK! APP & WEB EXPERT REVIEW 6

Experience Principles

We use the principles to

Evaluate the strength and quality of what is currently offered to users by Hello bank!
Facilitate critique during each phase of planning, design and development.
Predict the effectiveness of a potential solution.

The principles are based on the four brand pillars and best practice in user experience design.

Human

1. Language

The language in the service should speak to users in a single voice in the customer's language, with words and concepts that are familiar to the users and without jargon. Users should understand all dialogues and messages in the service.

2. Feedback

The service needs to instantly respond to user action and provide feedback in the appropriate form, visual, vibration and sound. Faster feedback feels more efficient and effortless.

3. Help

Even though the system can be used without documentation, it should have help/support content where it is needed. It should be easy to contact a real person so that users feel their question/issue is resolved quickly.

Safe

4. User control

The service should help users to make the right choice with every interaction. It should clearly communicate what will happen to users to avoid inadvertent destructive actions.

5. Consistency

The visual style should follow the brand guidelines consistently. Getting little details perfect will help to build trust.

Simple

6. Layout

User focus should be on their content, not on the interface. Good layout should minimise user effort by making content more visible and help them work without interference.

7. Content

Content including copy, images, videos etc., should be clear and contain only highly relevant information, which will make it easier for users to discover, achieve and learn.

8. Navigation

Users should always know where they are in the service optimized journey steps. Optimizing each step within the customer journey should give users confidence that they can easily get themselves out of any situation.

Smart

9. Context

Not all actions are equal, exploit contextual moments. The most important actions should be easy and fast to find and assist users to complete tasks.

10. Interaction

Reduce the distance between users and content as much as possible. Engage users to interact with content directly through guessable, physical, and realistic interactions.

France Core Tasks & Scenarios

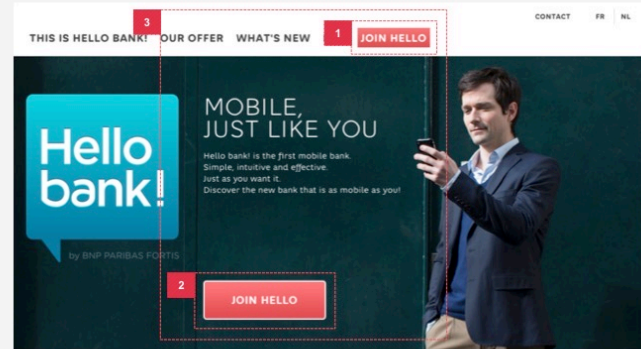

Core tasks on each platform

The following scenarios have been agreed for the review of Hello bank! web and app services in France. We created a set of scenarios, which include core tasks on each platform, and will use these scenarios to guide us to review the Hello Bank! France experience.

Platform	Core tasks to cover	Scenarios	Covered tasks
Web Service on Desktop Browsers	Opening a new account Adding a beneficiary Money transfer Home insurance simulator	A. A new customer joins Hello bank!	1. Opening a new account
		B. The customer needs to create a new payee. The customer signs in to Hello bank! web service. He creates a new payee who is not a Hello bank! Customer, then transfers money to his/her account.	1. Sign in to HB! Web service 2. Adding a beneficiary 3. Money transfer
		C. The customer is already signed-in to Hello bank! web service and looks for home insurance. The customer tries the home insurance simulator to get an idea about costs and coverage.	1. Home insurance simulator

Walkthrough. Scenario A. Task 1. Screen 1

Outcome Excerpt 4. Scenario-based screen issues and suggestions

Task

Task 1. Enrolment via website

Screen

1. Home
URL: <https://www.hellobank.be/en/PC/world/priv/index601/>

Issues

- The square button style is different from other visual language, and the copy should use full brand name.
Principle 5. Consistency
- The copy should say full brand name.
Principle 5. Consistency
- The button colour red is not welcoming. Red colour is primarily used for warnings and negative values and messages.
Principle 1. Language
- The button copy is too long.
Principle 8. Navigation

Recommendations

- Develop a concrete rule and style for different design elements (e.g. icons, buttons, popup across) and apply across all web services and apps.

Summary

France Web analysis and recommendation

Based on the evaluation of the 3 scenarios, we have concluded that overall Hello bank! France web service experience has a huge room to improve across all areas. Especially, the issue severity listed under **Consistency, Navigation, Content, Layout and Context** need to be improved immediately since those have huge impact on how the users perceive the brand and the likelihood to use and recommend the brand.

The most severe issue identified is **consistency**. Consistent design helps ensure that customers focus on the content, rather than on learning how to use the site. In addition it adds credibility and builds trust in the brand. To improve **consistency**, we strongly recommend to develop a **design guideline** that consists of a set of rigid rules and styles for all the elements on the web service (e.g. icons, buttons, colours, etc)

Navigation, layout, content and context, these 4 areas are intertwined and therefore they need to be addressed concurrently. The current navigation and layout follow familiar conventions in web design, however there is an opportunity to make the experience more unique and memorable. Thus, in order to offer a better experience each **contextual moment** should be identified and additional options (functionality, content) should be explored to offer the best possible experience for the users.

Short term fixes, recommendations and issue details on each screen have been included in the walkthroughs.

Scenario A. Task 1. Opening a new account						2/20
Language	Feedback	Help	User Control	Consistency		
0 (3)	0 (3)	1	0 (1)	0 (6)		
Layout	Content	Navigation	Context	Interaction		
0 (3)	0 (3)	0 (5)	0 (2)	1

Outcome Excerpt 5. Country Summary

KakaoTalk UX Review

Client: Kakao

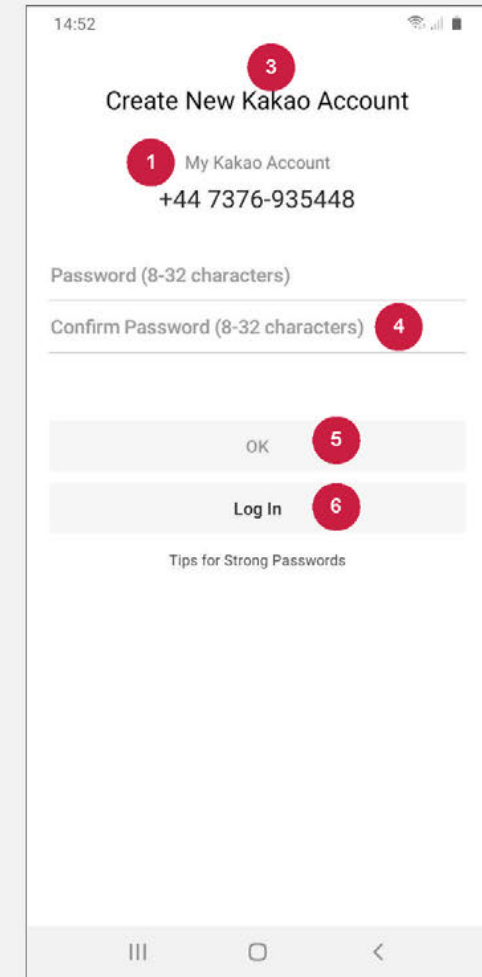

Role: Regional Director (UK)

Outcome: 100-page review report including improvement recommendations

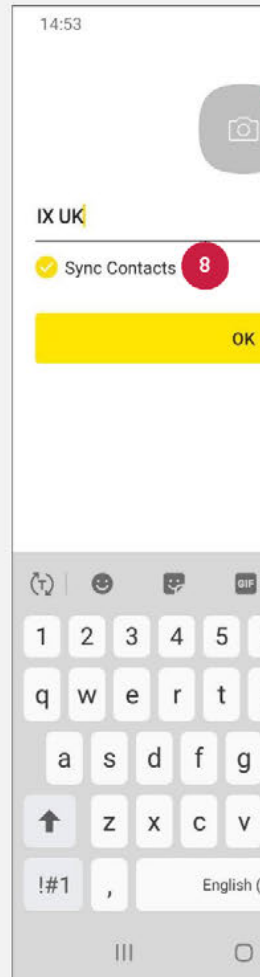

As European Director of Kakao IX, one of my two main responsibilities was conducting a UX review aimed at developing localization strategies for KakaoTalk's overseas growth metrics. I evaluated the mobile usage environment for European users and suggested improvements for contextually inappropriate or awkward English expressions from a UX Writing perspective, as well as functionality improvements. The project ultimately highlighted the crucial importance of considering UX and business development perspectives in early application structure design, as we faced limitations with KakaoTalk's single-build development environment and system that only distinguishes between four regions: Korea, Japan, US, and others.

SAMSUNG

Samsung EU Store

Conversational Filter

Client: Samsung

Role: Senior Interaction Designer

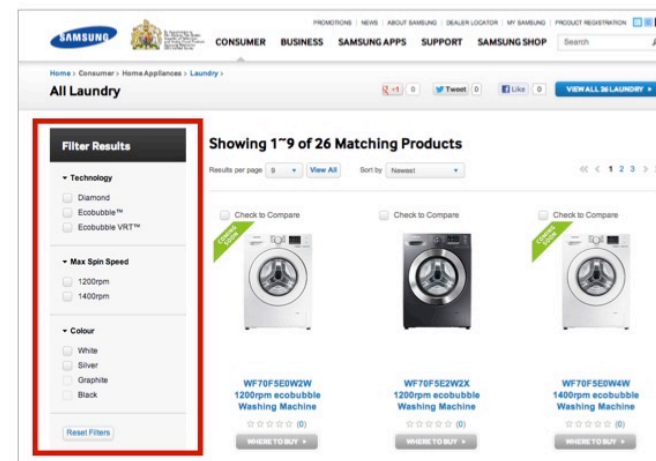

Outcome: Conversational filter system proposal for product search

While working at Cheil UK, I handled the purchase funnel improvements for Samsung's European homepage. We identified that consumers were struggling to choose between many similar home appliance specifications. Issues included inconsistent filter display and some filters lacking context (e.g., Spin Speed) that became meaningless to consumers. Among the improvements discovered, we proposed making filters conversational to help consumers make more confident choices.

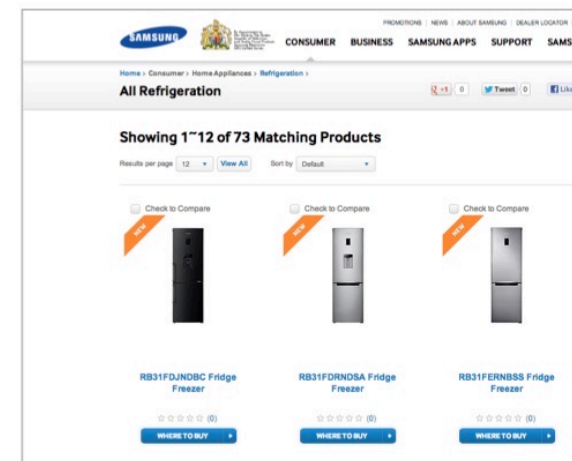

PROBLEMS: 1. Inconsistency in Product pages

Filtering tool is missing in some products pages

While laundry, oven, microwave, cooker hobs category has filtering tool, refrigeration, vacuum, air conditioning, cooker hoods has no filter. Rather than creating extra functions, building consistency in filtering is needed first.

3. Agile Delivery

Decisive action based on accumulated experience

Agile delivery is essential decision-making ability in lean design processes. This isn't just about work speed, but also about deciding how deep to go in initial research, how much detail to implement when proving concepts - such decisiveness is possible when project understanding is combined with 'accumulated experience'. I believe your company's new technologies, technologies under development, and the variety of user scenarios in designing user experiences based on such products will be quantitatively enormous. The speed required of individuals and teams when exploring and proving these many possibilities while keeping implementation feasibility open through continuous dialogue with the technical team will certainly make rapid execution an important factor.

SAMSUNG

Washing Machine Simple UI

Client: Samsung

Role: Senior Interaction Designer

Outcome: User scenario and UI/UX proposals

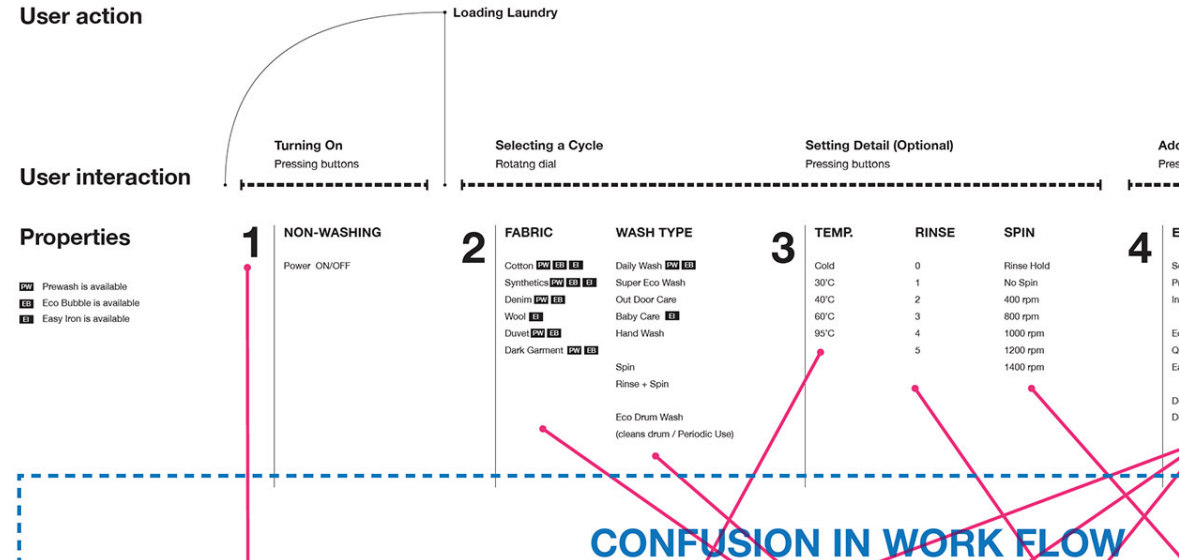

Link: <https://hyunsangcho.com/portfolio/samsung-washing-machine-simple-ui/>

While Samsung's home appliances were popular in Korean and US markets, their presence was so low in the European market that many people didn't even know Samsung manufacture home appliances. This led Native Design to be commissioned to develop 12 home appliance concepts for European market entry. I was in charge of the UX/UI for washing machines and induction ovens.

Analyzing Samsung's own market research, I discovered two insights that could determine the direction of the new UI. First, understanding of washing courses was low, and second, European market customers had high environmental awareness. I believed addressing these two points would create clear market differentiation.

Current washing machine setting flow

based on Samsung's Arno UI Function Tree

Washing machines physical procedure model

Washing machines physical procedure model

Matching machine setting flow to Physical Procedure model

POWER	CYCLE SCROLL				
On	Cotton	Super Eco Wash	Start	Water	Preparation
Off	Synthetics	Outdoor Care	Delay Start	Cold	None
	Denim	Baby Care		40°C	Prewash
	Duvet	Wool Hand Wash		60°C	Soak
	Dark Garment	Spin		95°C	Prewash + Soak
	Daily Wash	Rinse + Spin			
	Eco Drum Clean	My Cycle 1,2,3...			

Use cases

1. Select Cycle

User choose a cycle. Then, user can start the cycle by pressing the start button.

2. Change Cycle Detail

User can drag the points to change setting. As points go further from the centre, it gets darker, meaning consuming more energy.

3. Start Cycle

Press the button to start a cycle.

Outcome Excerpt 2. Direction - Understanding wash cycle settings through linear arrangement of actual washing process

Outcome Excerpt 3. Initial Concept - Visual representation of energy usage per cycle using Eco Bubble

Use cases

1. Turn On & Change Cycle

Long-press (3s) the button to turn machine on. Last used cycle shows up. User can start the cycle by pressing the button again.

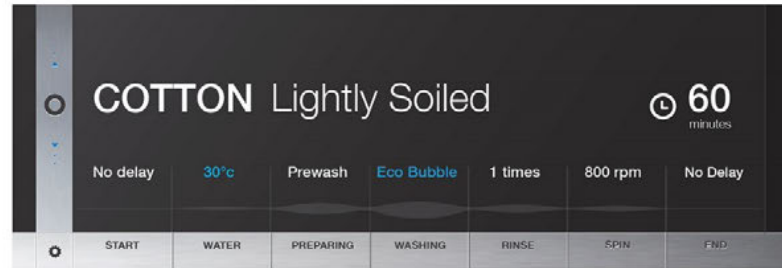

Swipe up and down the bar to change cycle. User can start the cycle by pressing the centre button.

2. Change Cycle Detail

Press a bottom button to change cycle detail.

Outcome Excerpt 4. Initial Concept - Linear UI layout matching actual washing process with settings

Outcome Excerpt 5. Initial Concept - Linear UI + Energy Usage

Use cases

1. Sense as you load & One touch go

1. As user loads laundry into the drum, it turns on automatically by sensing weight, then starts to analyse (Weight, Soil, Fabric) it to find a best washing cycle for the laundry.

2. Once analysing stage is finished, a button wheel flashes to let user know that you can

Outcome Excerpt 6. Initial Concept - Circular UI focused on simplicity

Use cases

2. Change Cycle

Once analysing stage is finished or after turning the machine on by doing long-touch on the small button, user can rotate the wheel to change the cycle.

3. Change Cycle Detail

After user decided on the cycle, detail of cycle (soil level, fabric type, water temperature) can be changed manually by swiping the label, followed by the cycle name change to Custom.

4. Add options

User can touch '+' to add/remove options or to go settings.

Outcome Excerpt 7. Initial Concept - Physical button usage cases for circular UI

KEY UI ELEMENT 2

In-and-Out UI

To maximise the circular display's character including formfactor usability, concentric rings are implemented in screen UI. Main screen UI is consisted of four concentric rings. The biggest ring is for cycles, second biggest ring is for soil levels, third biggest ring is for cycle stages and the smallest ring is for detail change.

Example Cotton 95°

Control Focus Changes

Wheel Position : Front

Wheel Position : Back

Washing Machine Simple UI ECO BLOB

Eco Blob

The Eco Blob is a generative visual representation of each cycle's energy/water consumption in single cell creature form. Each cycles and settings have its unique shape. The bigger blob means consuming more energy. The purpose of the Eco Blob is to give user a sense of energy consuming level of their laundry visually as well as giving iconic image of each cycles.

The default cycles are consisted of 4 stages, Water temperature, Wash, Rinse and Spin. As user adds extra options such as Prewash or Delay Start the number of stages increases upto 6. Or some cycles, Rinse, Spin and Drum Clean, have less than 3 stages.

5 Different Sections Based on the Number of Stages

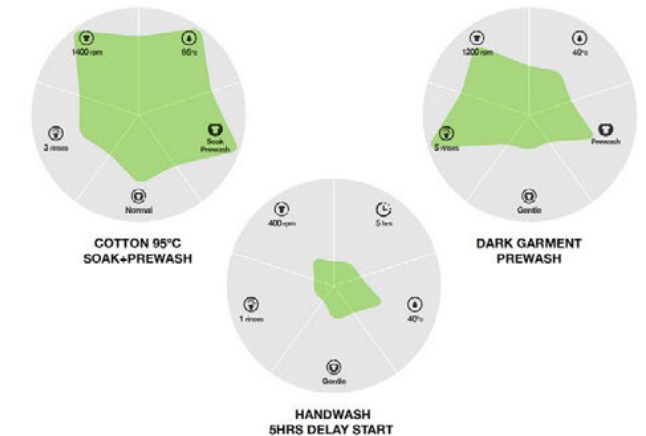

White Line - Cycle Stage Separation Red Line - Setting Level Mark

Examples 4 Stage Blobs

Examples 5 Stage Blobs

Outcome Excerpt 8. Concept Development - Evolution towards intuitive operation with physical UI

Outcome Excerpt 9. Concept Development - Visual representation of energy usage by cycle

Nike RunTrack

Client: Nike

Role: Senior UX Architect

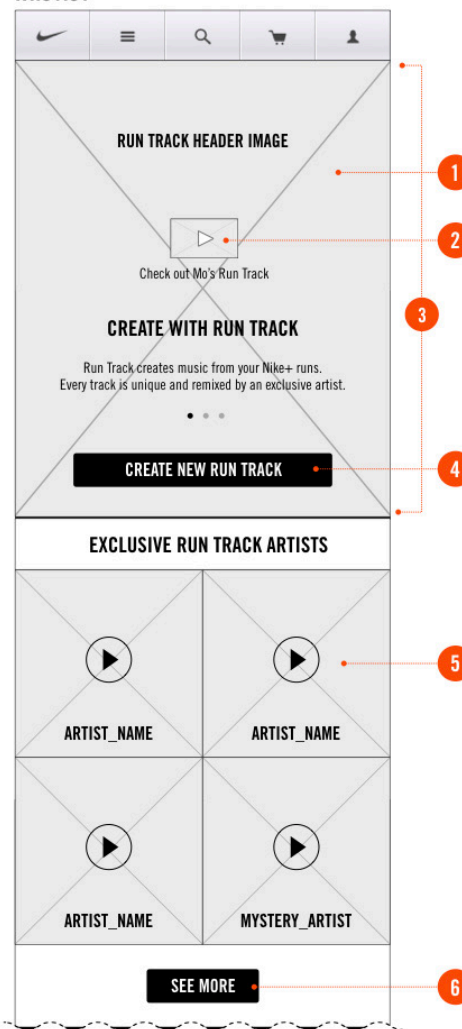

Outcome: Web app for users with Nike running data

Link: <https://hyunsangcho.com/portfolio/nike-runtrack/>

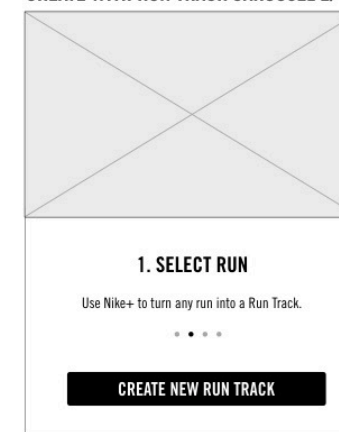

RunTrack is a web app that generates unique music tracks by mixing based on Nike Plus running data (speed, distance, direction changes) and environmental parameters (weather, time). Users can select previous runs and DJs to generate music tracks, then listen while seeing how different data influenced the music through the RunTrack music player. We focused on features like unlocking sound samples from various famous artists through usage and enabling sharing of mixed music. During development, we improved efficiency by creating detailed prototypes including micro-interactions and animations for music playback screens to ensure accurate communication with developers in Japan.

DEVSISTERS

CookieRun VR

Client: Devsisters

Role: Director

Outcome: Official launch on Meta Quest Store

Link: <https://hyunsangcho.com/portfolio/cvr/>

After Meta Quest 2's release in 2020, I was eager to work on a VR project as I experienced the platform in earnest. Believing that games still provide the best VR experience, I leveraged my understanding of IP from managing Kakao IX and the potential of VR platforms to propose and lead a VR game project using Cookie Run IP at Devsisters. I led all aspects of VR development including concept, team building, production management, and Meta partnership building, successfully creating from concept to prototype within 6 months and launching on the Meta Quest Store without delays during the 18-month production period after establishing partnership with Meta. The project received positive responses, being selected for Japan Meta TVC, Quest 3 launch popup showcase, and retail demos. Through this project, I believe I developed team leadership skills, understanding of UX in 3D and VR spaces, and the ability to complete complex projects within budget constraints on time. From a UX perspective, it was a new challenge, and I learned that maintaining immersion is what creates the biggest difference from regular screen experiences.

Unique CVR Experiences

1. Explore the human-scale world as a cookie

The moment you step into this CookieRun VR game, you got shrunk to the size of the cookie. You will explore this magical witch's castle the way that you have never experienced before. Plus, you will meet the cookies as if they are right next to you.

DEVSISTERS | COOKIE RUN

Short Intro to CookieRun VR

Short Introduction:

In this game, the player takes on the perspective of a not-so-brave newborn cookie, GingerBrave. As an action adventure game, it combines elements of combat and puzzles as the cookie overcomes various challenges in a medieval-like world filled with magic, alchemy, and the occult. Along the way, GingerBrave meets new cookies, learns about the world, and gains true bravery. The ultimate goal is to escape from the castle where all the cookies were born, together with their newfound companions.

Keywords:

Bravery, Companions, Escape

Environment:

Medieval, Witch, Magic, Alchemy, Occult

Main Gameplay Elements:

Exploration, Growth, Combat, Mini-games, Puzzles

Enriching Elements:

Adorable characters, Cinematic cutscenes, Fun interactions

Unique CVR Experiences

1. Journey in a human-scale world as a cookie:

From the moment you immerse yourself in CookieRun VR, you will be shrunk to the size of a cookie. You'll experience the enchanting witch's castle from a unique perspective that can only be possible in your imagination, offering an immersive adventure that's genuinely one of a kind.

2. Explore with companion cookies and pets:

Initially, you may feel insignificant as a solitary cookie. Your strength alone might not suffice for the daunting journey that lies ahead. But fear not, you won't be alone. Other cookie companions will accompany you, standing with you against all odds. Moreover, your faithful pets will prove invaluable in times of great difficulty. They are always there, waiting to be summoned.

3. Mini games and epic battles:

Diverse mini games will test your skills, offering new obstacles that may not be conquered on the first attempt. Also, The Darkest Army and other monsters will try hunt you down. Some of them are as small as you are, but also huge monsters such as witch's black cat, three loyal followers like the Toad, the Crow and the Snake and more. Make sure you collect rewards after each battle.

4. Distinctively themed stages and the cookie habitats:

In the witch's castle, besides the magical look due to its magical nature, each stage has a unique theme including a mysterious garden, auditorium, kitchen and more. Plus, you will find cookies' behaviours in their little habitat hidden in each stage quite funny for it resembling humans.

5. The CookieRun story never told before and cinematic cutscene experience:

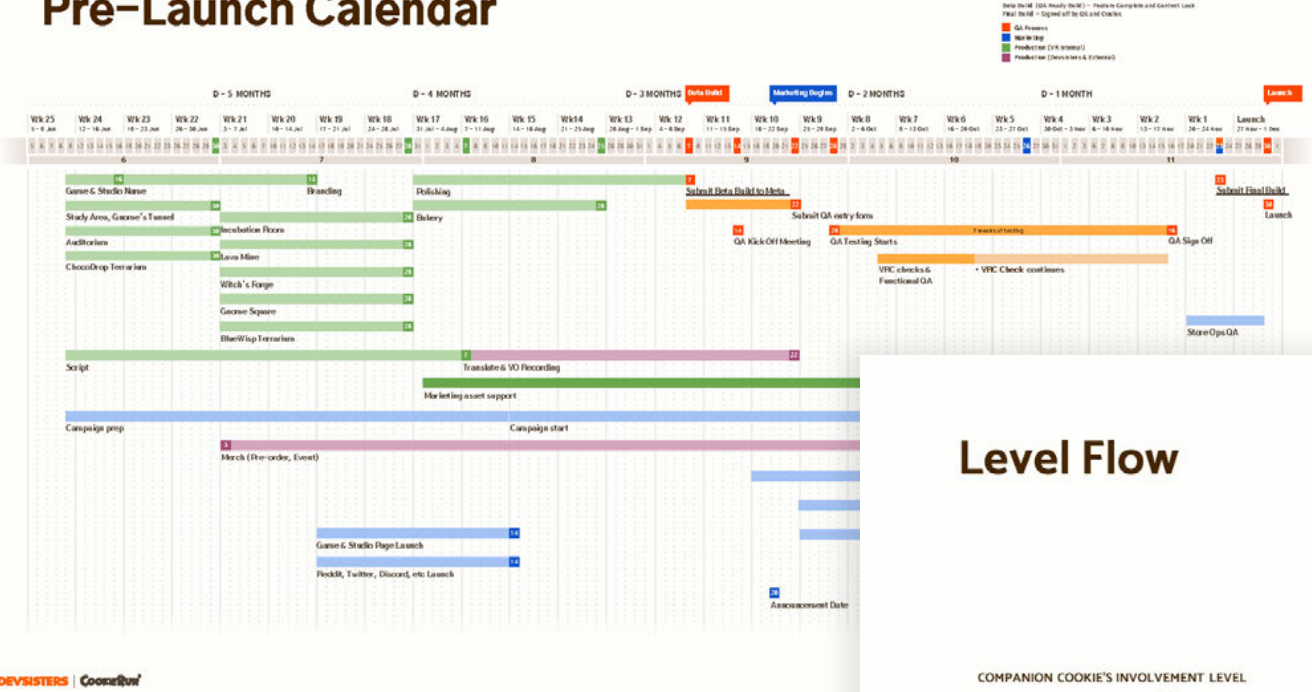

Players will be able to uncover an entirely new side of the CookieRun universe that's never been explored before.

4. Value Validation

Observing users, discovering blind spots
and validating hypothesis

Value validation is crucial for both design and business. If a product is launched without any kind of validation after significant time and money investment, it's highly likely to be ignored. While designers have experience, research capabilities, and implementation skills, they ultimately create something to prove hypotheses rather than provide definitive answers. Therefore, we must observe actual users through testing and identify unexpected design blind spots for improvement.

Nike Training Club App

Client: Nike

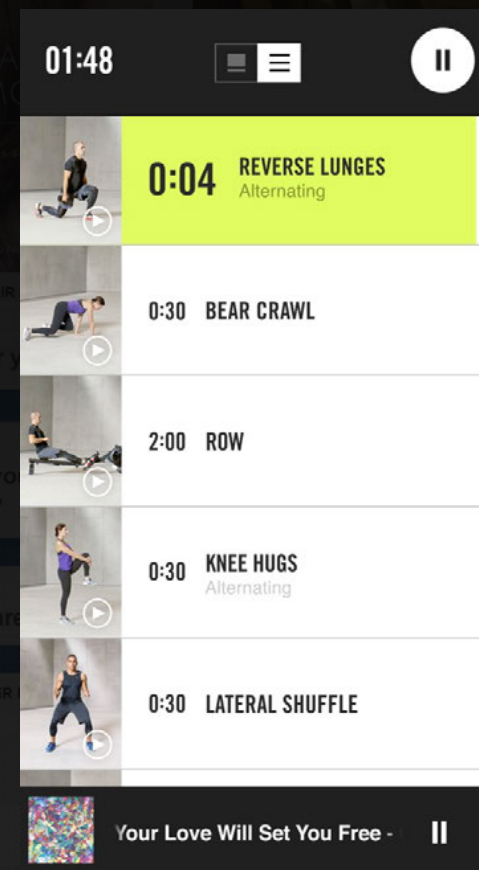

Role: Senior UX Architect

Outcome: Nike Training app, Testing reports

I worked on the On-boarding and During-session parts of Nike's Nike Training Club (NTC) app for about 6 months. NTC's most important feature is enabling users to train alone while watching the screen without a personal trainer. For usability testing, especially to improve session completion rates, we needed a perfect environment to test the app in use, so the company created a mini-gym with appropriate equipment in-house for quick testing and immediate feedback implementation. This gave confidence to me and other participating designers when creating deliverables and naturally led to good testing results. However, optimizing On-boarding to reduce initial dropout rates was challenging as repeated testing was difficult due to learning effects, requiring new test candidates to be selected at regular intervals.

Outcome Excerpt 1. During-session Prototype

IF YOU ONLY HAVE TIME TO READ ONE SLIDE

- NO MAJOR DIFFERENCES NOTED BETWEEN MEN AND WOMEN
- **MOST CHOSE TO BROWSE FIRST** RATHER THAN PERSONALIZE FIRST, BECAUSE THEY WANT AN OVERVIEW OF WHAT'S THERE BEFORE THEY COMMIT
- **USERS FOCUSED ON A SINGLE SPORT NEED TO UNDERSTAND HOW THE APP MIGHT SUPPORT THEM** OR THEY RISK DISAPPOINTMENT
- **SELF-ASSESSMENT NEEDS TO BE LESS SUBJECTIVE TO BE MORE ACCURATE**
- **PERSONALIZATION NEEDS TO FEEL MORE PERSONAL** BUT IT ISN'T RELEVANT TO THEM AS INDIVIDUALS AND THEIR NEEDS
- **USERS WERE NOT KEEN TO SHARE** BECAUSE TRAINING IS PRIVATE AND THEY DO FOR PRIVATE SELF-DEVELOPMENT
- **WHAT THE TRAIN SECTION IS FOR NEEDS TO BE OBVIOUS** AND NOT CONFUSED BY THE TILES AND NOT CLEAR THERE WAS A TRAIN SECTION

Outcome Excerpt 2. On-boarding test Summary

BROWSE FIRST, THEN PERSONALIZE

VERSION 1C HELPED REINFORCE THE PERSONALIZE MESSAGE. WHEN CHOOSING TO BROWSE THEY KNEW THEY COULD PERSONALIZE LATER.

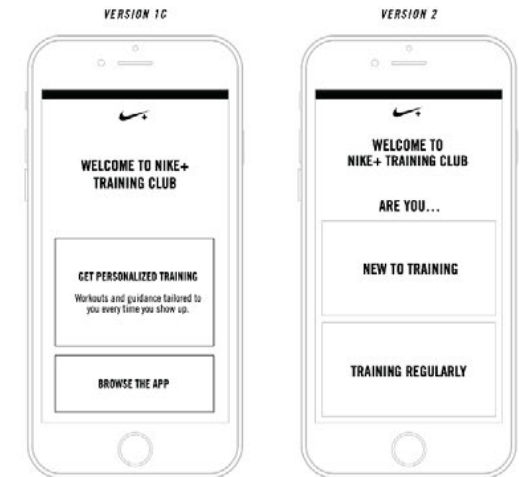

VERSION 2 DIDN'T FEEL LIKE A TRUE BROWSE BECAUSE IT WAS NOT DIRECT INTO THE APP. USERS OFTEN PERCEIVED THIS ROUTE AS STARTING TO PERSONALIZE WITH THE NEW TO TRAINING QUESTION.

"Would be nice to have the option to browse the app before hand, to look through it - you could make sure it's a good fit for you and what you want to do, you could see the different options, and see how you want to use it"

- User 8, PDX

"Ver 2 is better for me - because I like to browse an app before entering too many details - I don't just want to see what the training is - I want to see the app as a whole - I like to look around before using it - to see what it offers"

- User 1, LDN

Outcome Excerpt 3. On-boarding test, Welcome Screen

WHAT IS THE RIGHT KIND OF SOCIAL?

MAJORITY OF USERS WERE NOT KEEN TO SIGN IN THROUGH FACEBOOK, WERE NOT INTERESTED IN POSTING ABOUT THEIR WORKOUTS OR SHARING INFO ABOUT THEIR WORKOUTS.

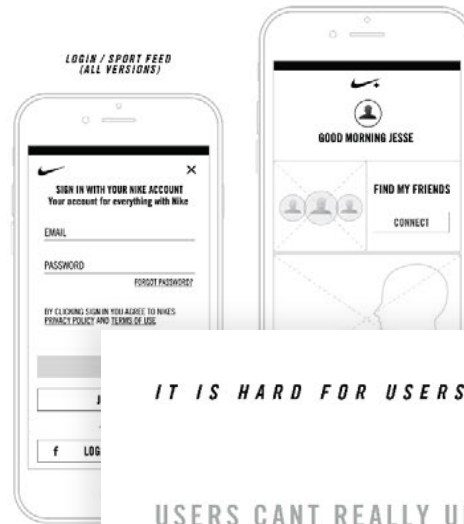

5/25 SAID THEY WOULD LOGIN WITH FACEBOOK

"I like social media but I don't like to share my exercise routine.. I don't like linking to Facebook - it's a bit egotistical..."

- User 3, LDN

"When I workout it's for me, not for others."

- User 1, LDN

IT IS HARD FOR USERS TO ACCURATELY SELF-ASSESS

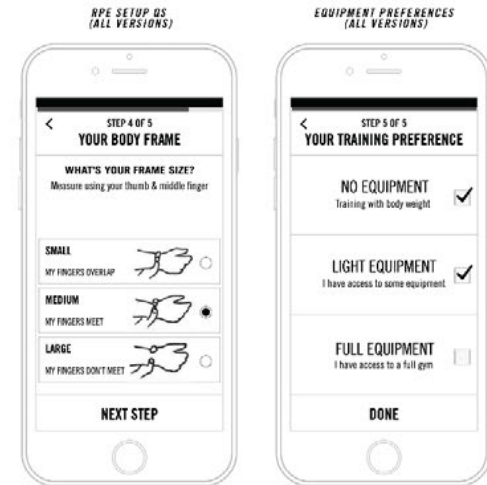

USERS CANT REALLY UNDERSTAND EXACTLY HOW THE QUESTIONS THEY ANSWER IN THE FITNESS ASSESSMENT TRANSLATE INTO WORKOUTS FOR THEM... IT'S A LITTLE BIT GUESSWORK.

"When you say frame - is that upper body? but you are measuring your wrist? Does that determine your frame as your body?"

- User 7, LDN

"If you have access to the gym machines - you can have the option to say what you will be training on"

- User 7, LDN

Outcome Excerpt 5. On-boarding test, Self-assessment

holidays

Virgin Holidays' Holiday AI

Client: Virgin Holidays

Role: Senior UX Architect

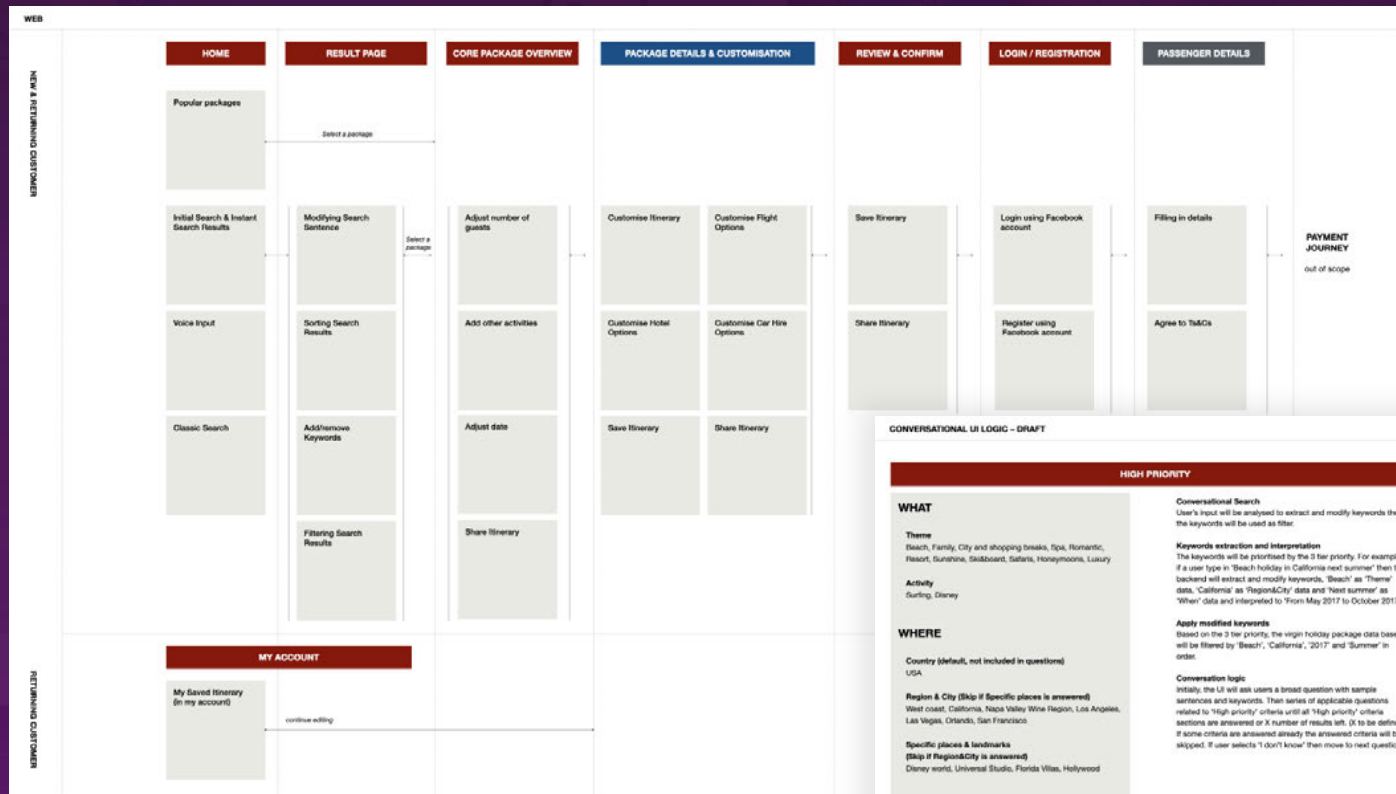

Outcome: AI-based holiday package recommendation system

Virgin Holidays, a leader in UK's traditional holiday culture, relied heavily on call centers for bookings and still had many customers using paper brochures.

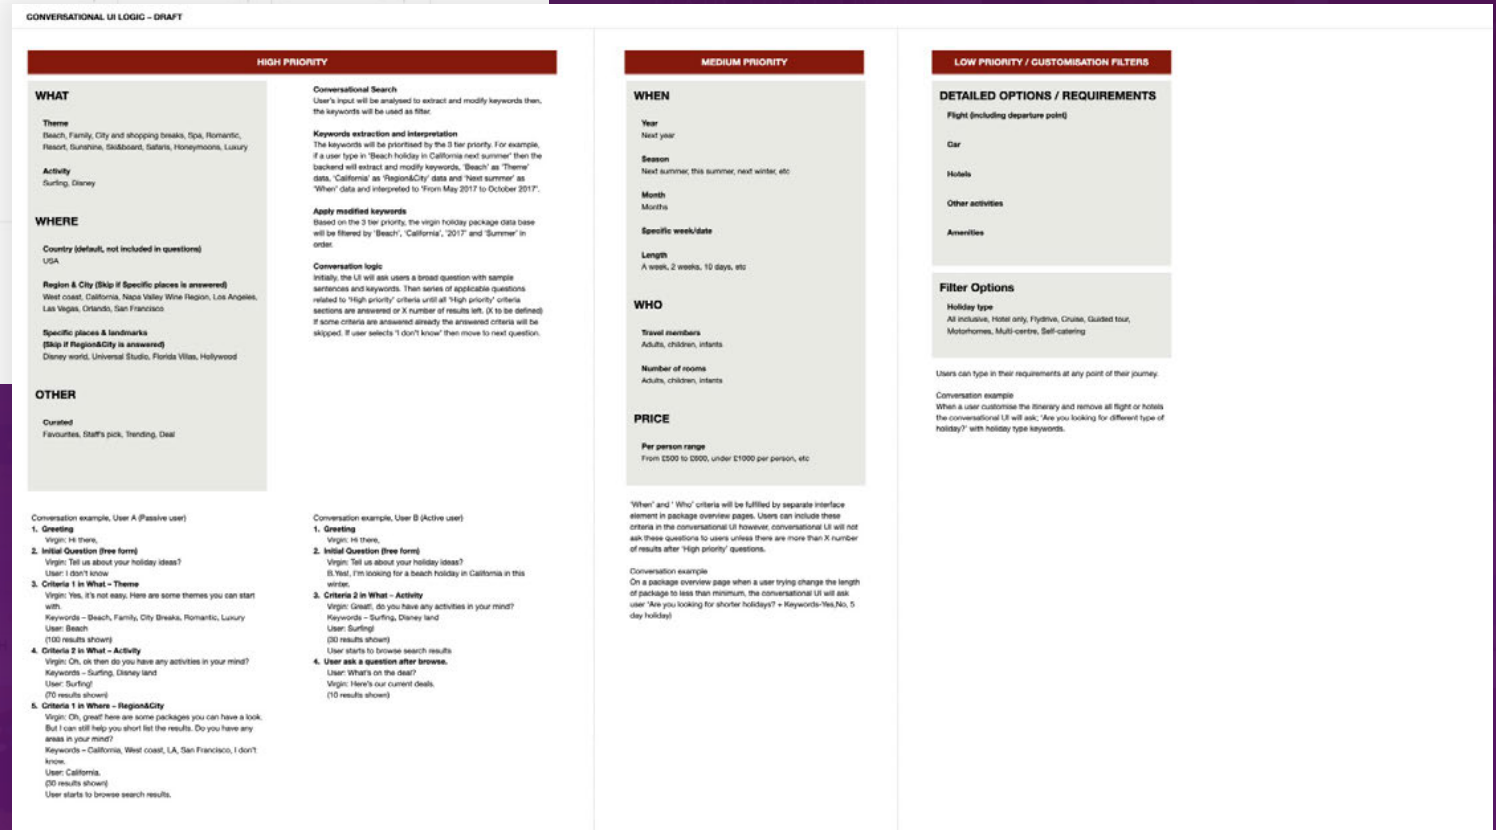

They wanted to test conversational AI (IBM Watson-based) to help customers enjoy more diverse and personalized holidays while reducing call center dependency. For research, I visited the call center to study operator behavior patterns for a day and analyzed user journeys for bookings through existing brochures and website to create priority-based expected scenarios. These scenarios were trained into Watson and led to a working demo. As my first project considering AI use, it was very interesting learning new concepts and seeing how AI and conversational UX could expand further.

Outcome Excerpt 1. Ideal User Journey based on the current service flow

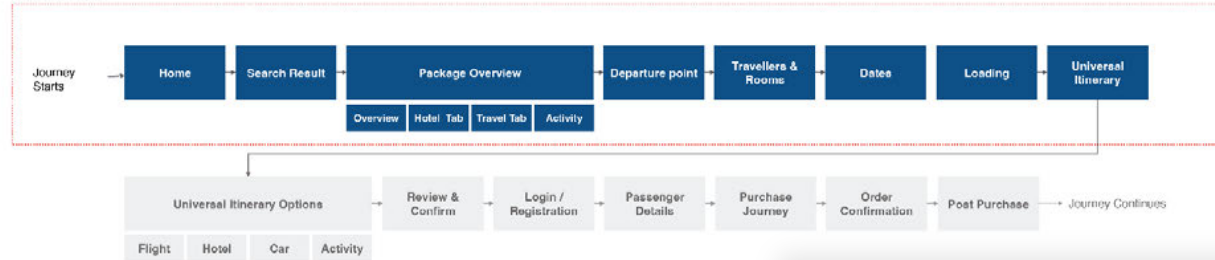

Outcome Excerpt 3. User Journey step-by-step summary of key features

Outcome Excerpt 4. The direction of the conversation based on the factors that consumers consider important

1st Demo Scope

1st Demo

A family of 4 is looking for a 10-day family holiday to Disney World Orlando in the USA for the next summer. A member of family who have never booked a holiday with Virgin Holidays is starting a search on Virgin Holidays website using the conversation UI.

+ details e.g age, sex,

Outcome Excerpt 5. Demo Scenario steps

VIRGIN HOLIDAYS

DEMO SCENARIO

CONFIDENTIAL & PROPRIETARY INFORMATION

Home screen

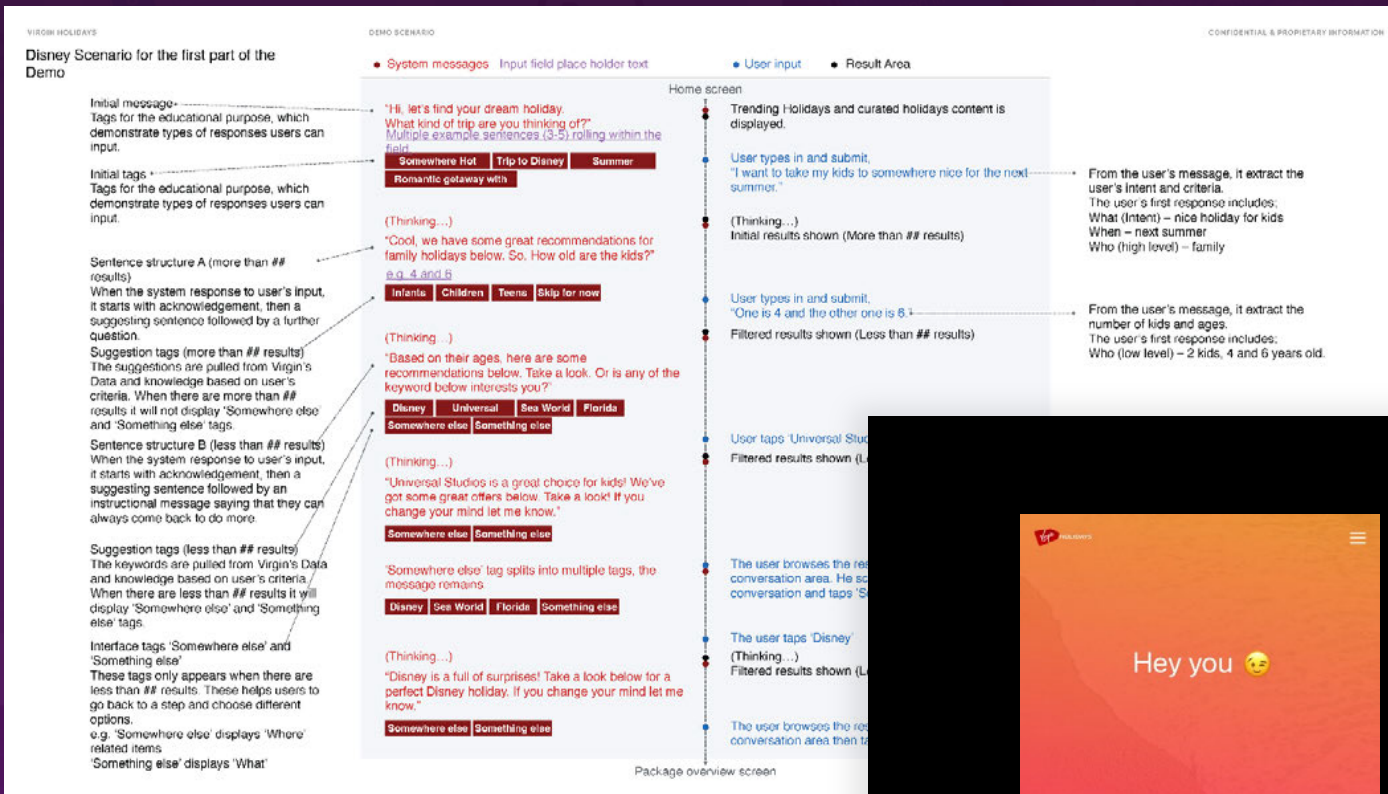

System

- When user visits the site, it checks if the user is the first time visitor or returning customer. The user is a first time visitor so, the system asks the first question with a greeting message and some keyword suggestions (Relaxing, Romantic, Disney, etc.) , "Please describe your dream holiday."
- COPY**
- The system responds to the user message. **'That's a great idea. We have amazing Disney World holiday packages, you can browse below packages. or you can also tell us more about it.'** Then following message displays with keyword suggestions (Family, 2 Adults and 2 Kid's, 2 Adults, a group of people) 'Who are you travelling with?'
- The following message displays, 'It seems like a family holiday. Have a look below we have variety of packages that make you and your kids happy.'

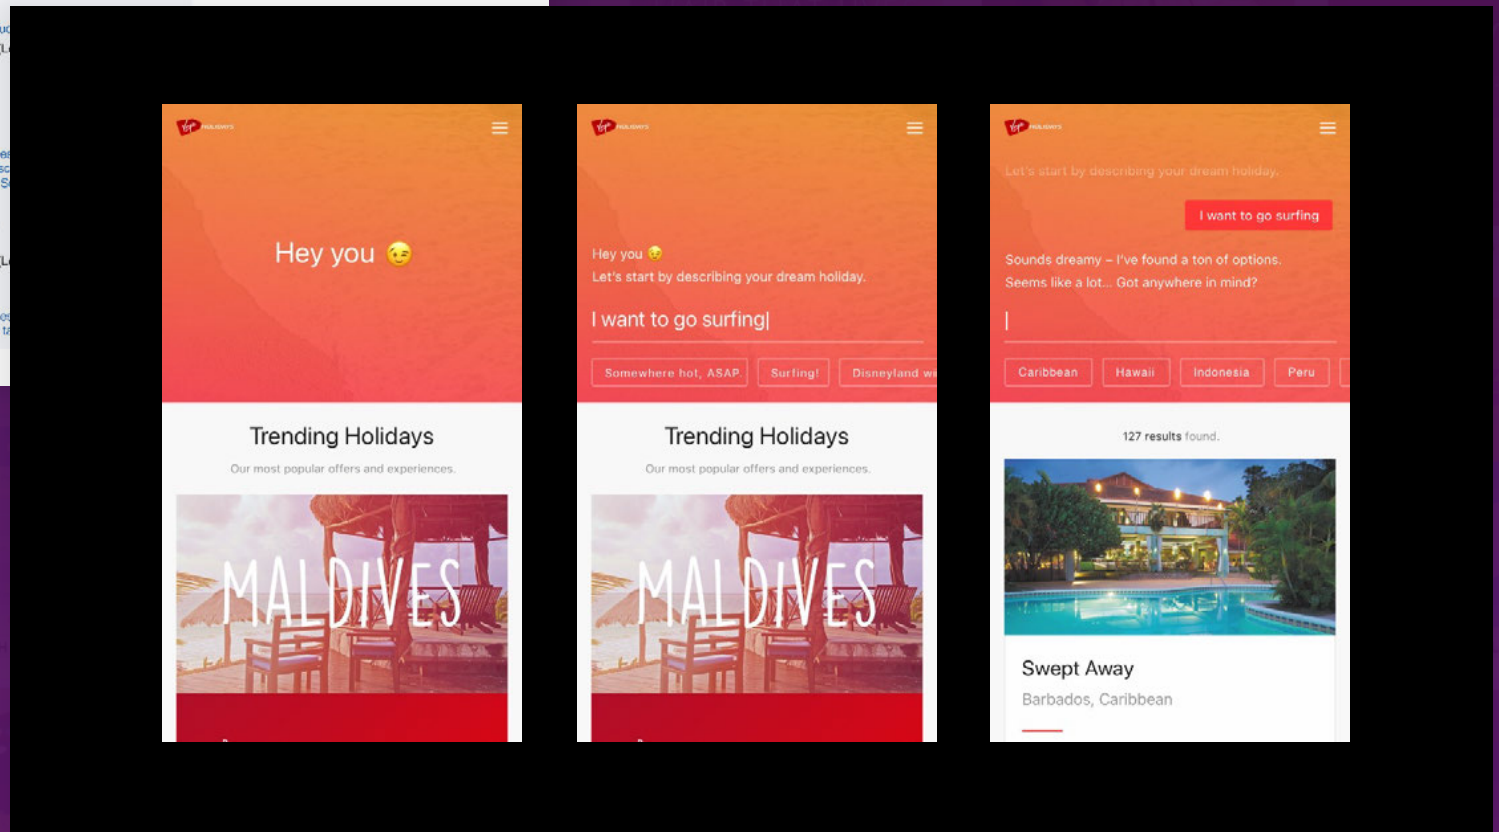

User

- The user visits the website.
- The users sees the first message and responses by typing in 'I want to goto Disney next summer.'
- The user selects '2 Adults and 2 Kids' keyword.

Outcome Excerpt 6. Demo scenario step-by-step description

Outcome Excerpt 7. Demo Scenario Dialogue and Contextual Options

Outcome Excerpt 8. UI Design

Saudi Aramco Driving School

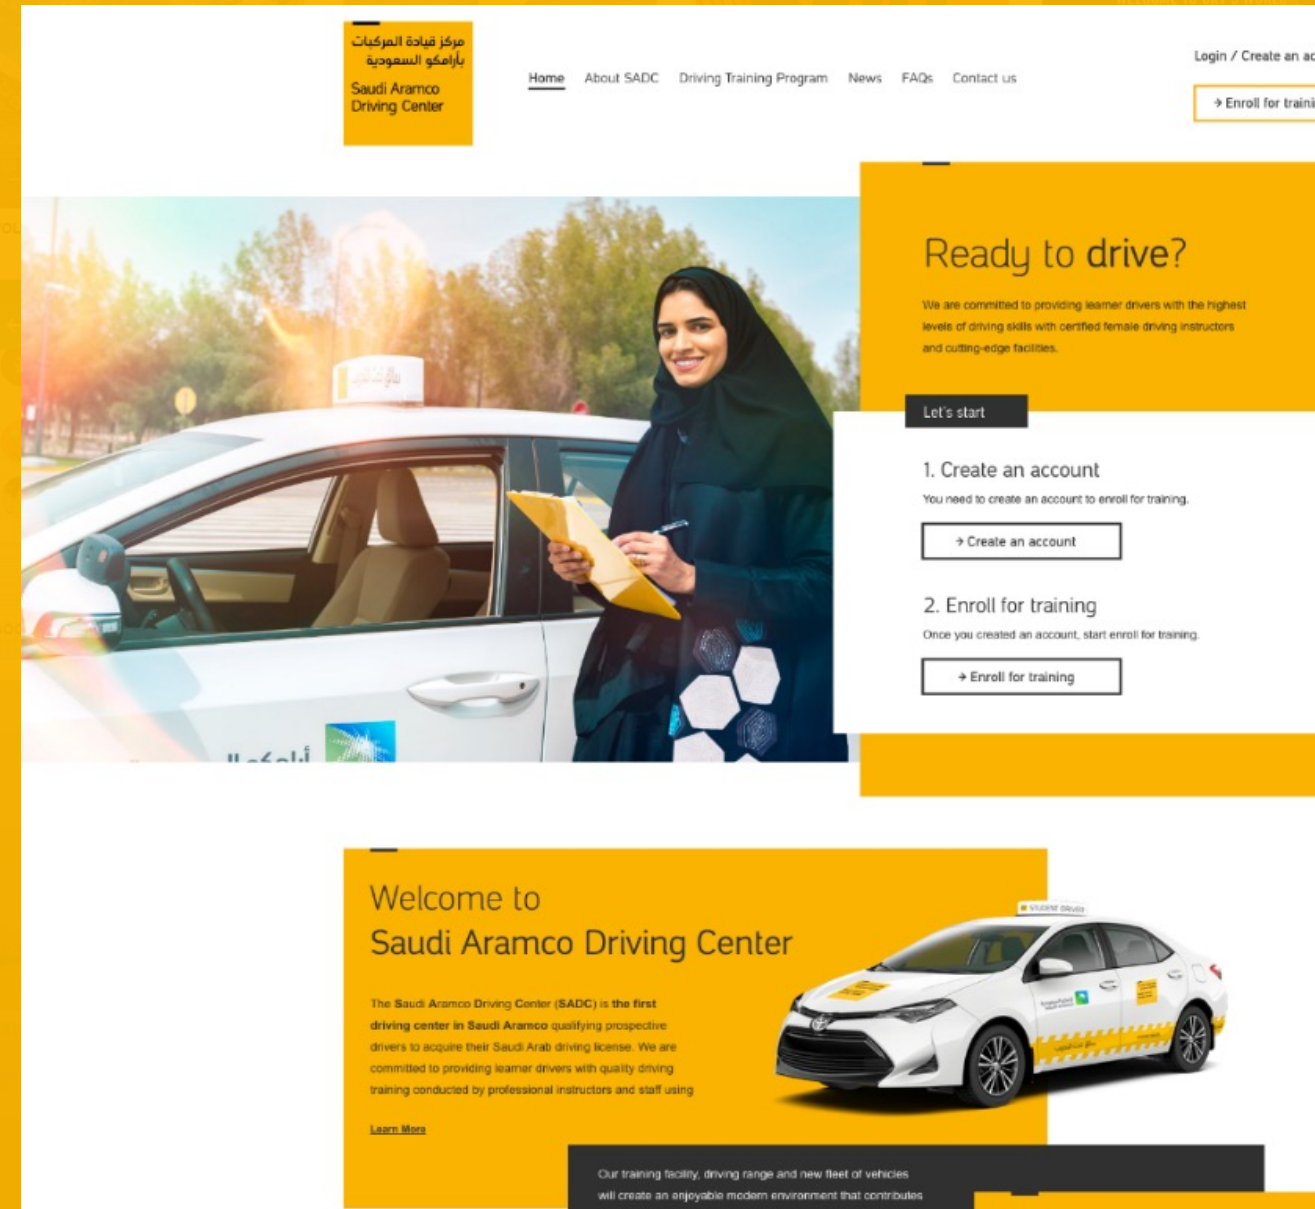

Client: Saudi Aramco

Role: Lead UX

Outcome: Driving school desktop/mobile website

Amid major changes including Aramco's IPO, Saudi women driving rights, and cultural opening, there was a significant need at the national level to prepare Aramco's Digital service as a major part of brand value. One aspect was creating an environment for women to learn driving, requiring UX/UI work for a digital service enabling women-only driving school registration, lesson scheduling, and virtual driving training. An interesting discovery from initial testing with 10 Saudi women aged early 20s to mid-50s was that despite the service being in English, they showed right-to-left reading patterns typical of Arabic, and felt overwhelmed by wide desktop screens. This led us to change two-column design patterns to single columns and make desktop interfaces more similar to mobile UI patterns.

(Please understand that due to Saudi's characteristic closed nature and the company's oil industry specificity, we could only save final images without work processes.)

Outcome Excerpt 1. Design

5. Human-Centric

Good product development begins with sincere interest
in people at every stage of the design process

There are still many moments when we forget that UX is a human-centered field, whether due to personal ego or external and internal reasons. UX should not be driven by personal preferences but must be developed with users in mind, meeting them throughout the process. As introduced earlier, I've worked on various projects in various positions. Through this process, I've gained diverse skill sets and improved at expressing ideas, but the biggest learning so far is the conviction that good projects ultimately come from being human-centered.

Thank you
